

Speaker II

**EXTERNAL SPEAKER
FOR THE APPLE II**

\$34⁹⁵

plus \$2 S&H

In the years since the Apple II's introduction, programmers have learned to push the computer's capabilities to the limit. The incredible graphics and sound generated by today's software is probably beyond what even creator Steve Wozniak had originally envisioned.

Apple owners routinely connect monitors and joysticks to their Apple to make full use of its graphics power. However, the Apple's tremendous sound capabilities are all but lost as they must be funneled through the Apple's tiny, inadequate internal speaker.

The elaborate sound effects, music and synthesized voice that is found in much of today's software can hardly be appreciated since the inefficient internal speaker cannot reproduce the sounds as they were meant to be heard.

The Speaker II has been specially designed to bring the sound capabilities of your Apple to life. The Speaker II utilizes a highly efficient speaker that gives you plenty of volume without using any power from your Apple. In fact Speaker II gives you so much clear crisp audio that a front panel volume control is included so that you may adjust it to your listening environment.

Desk space around your computer is probably already at a premium. The Speaker II's efficiency allows it to have a small 3.5 x 5.5 inch footprint. The stylized sloping custom molded cabinet compliments and enhances your Apple system. The color is molded into the practically indestructible case and the front grille and base are metal. The quality construction matches that of the Apple itself.

Installing the Speaker II takes seconds and the internal speaker may be reconnected at any time.

The Speaker II brings the sound capabilities of your Apple II, II+ or IIe to life. Hear what you've been missing!
